

INK CONTAINER OPENER

Abstract of the Disclosure

An ink container opener has a first portion and a second portion which are approximately perpendicular to each other. Each portion has an opening for receiving an ink container cap. The opening of the first portion comprises a plurality of ridges extending along at least one side of the opening. The first and second portions are formed of a unitary construction and form an L-shaped configuration. Force is applied to the container body to separate the cap from the body as the cap is supported by the opener.
